1<sup>st</sup> July 2005

Dear Mr Vintcent,

We have been using EnviroCare in our vehicles transporting human blood for two years. This is done to maintain the highest possible standard of hygiene and to eliminate the risk of contamination from bacteria or viruses during the transportation of blood on a daily basis.

The EnviroCare solution is incorporated into the fibre-glass interior shells built into our vehicles, wherein the blood supplies are held, during their construction.

As you will know, National Blood Service is an integral part of the NHS carrying out a specialised and essential service, and it is of paramount importance within the NHS that risk of contamination to such life support services is kept to the absolute minimum, or, where possible, eliminated. The EnviroCare product has been tried and tested and is performing its function to our complete satisfaction.

You may show this letter to anyone with similar interests in maintaining high standards of hygiene within the health services.

Yours sincerely,

Larry Bannon  
National Fleet Manager  
National Blood Service
